# DEEP HOLE DRILLS

**H**ammond & Company was founded in London in 1939 by Charles Hammond and is now situated in Hemel Hempstead, Hertfordshire, close to Junction 8 of the M1 motorway.

The business activity of the company was then, and is now, precision gauge and toolmaking. In more recent years however, we expanded into the specialised field of Deep Hole Drilling and are now the UK's leading manufacturer with an internationally acknowledged expertise.

A gauge making environment, state of the art purpose built machine tools and the latest CNC technology combine to ensure consistent quality control. Equally important is our policy towards customer service, both in terms of accurately scheduled deliveries and instantly available expertise.

### DEEP HOLE DRILLING

Deep hole drilling is defined as a process of continuous, uninterrupted drilling by means of controlled chip formation and evacuation.

Only three factors are relative to achieving this definition: tool design, coolant delivery and feed rate.

There are various tool designs available, of which the most commonly used is the single fluted gun-drill. Selecting the right tool for the job will depend on the importance of several possible requirements: diameter, depth, straightness, surface finish, diameter tolerance, penetration rate, cost per hole.

The best results are obtained when using a specially designed and dedicated deep hole drilling machine. However, if the capital cost cannot be justified, CNC, high volume and toolroom machines can be effectively employed particularly when it is desirable to perform additional operations to drilling.

Hammond and Company's engineering department will be pleased to discuss your application.

### DRILLING SYSTEMS

## GUN DRILL DESIGN

HAMMOND

A gundrill consists of three components: tungsten carbide cutting tip, hardened steel shank and a soft steel driver.

Before drilling commences the gundrill must be supported by a guide bush or pre-drilled start hole. Coolant is delivered directly to the cutting edges through the hollow shank and the chips are evacuated back along the V configuration of the tip and shank.

The periphery of the cutting tip is contoured in such a way as to provide both support pads and lubrication galleries. The forces generated by the single sided cutting action act directly on the support pads creating a burnished surface finish and size control down to IT7 tolerances.

Gun drills operate at relatively high cutting speeds with low feeds per revolution. Approximate starting values are shown in the charts on this page.

Feed rates are critical to chip formation. The values shown here may need to be adjusted for optimum results.

Reliable chip evacuation and good surface finish can only be ensured if sufficient coolant volume and pressure are available.

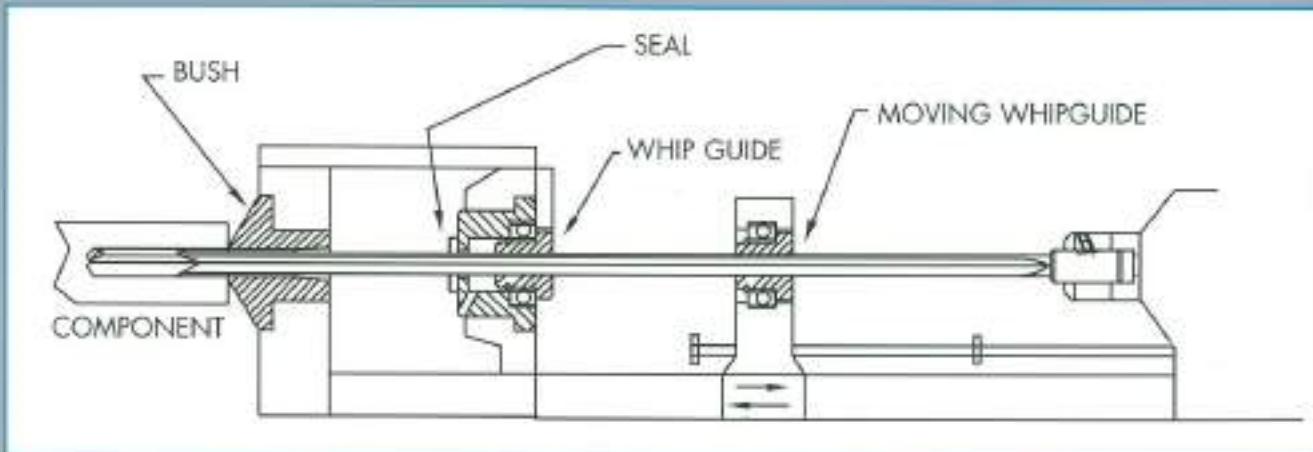

#### GUNDRILL WHIP MOMENT

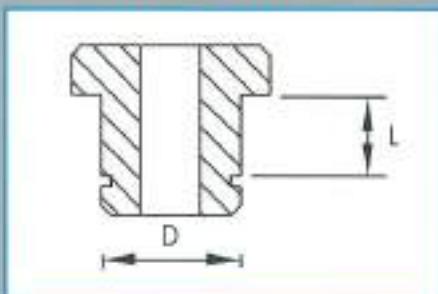

To establish the maximum length to diameter ratio of an unsupported drill for any given surface speed, trace the surface speed to the intersection of the curve and read off the L/D ratio on the vertical scale.

Example:

Using a gun drill at 100 metres/min, the L/D ratio is 55:1 therefore for a dia. 10.0 gun drill the maximum unsupported shank length is 550mm

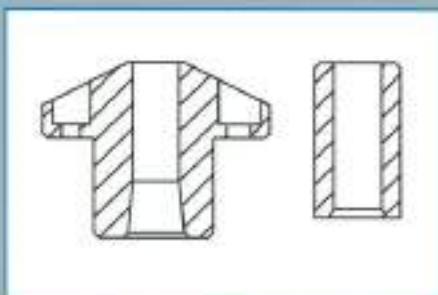

## POLYURETHANE WHIPGUIDES

D	L
17,0	10
30,0	13

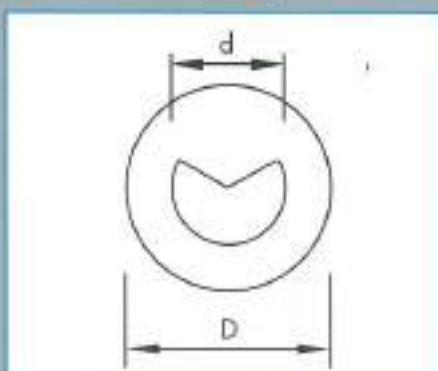

When ordering please  
specify the tip diameter  
of the drill

## START BUSHES

Manufactured to order

## CHIP DEFLECTORS

TYPE	D	d RANGE
A	19,12	3,17 TO 6,34
B	24,40	6,35 TO 9,51
C	31,75	9,52 TO 15,86

E	44,25	19,05 TO 25,39
F	50,85	25,40 TO 31,74

When ordering please specify the tip diameter of the  
drill. The d range has a size to suit each diameter  
of tube.

## GUN REAMER

Single and multi-flute coolant fed Gun Reamers.

Re-grindable. Excellent bore straightness, surface finish, roundness and diameter adherence.

Primarily used in the Automotive, Aerospace and Marine industries for reaming valve guides.

Manufactured to customer's specification.

Diameter range  $\phi 5.0$  to  $\phi 20.0$

VALVE GUIDE REAMING

## PROTEN

Fast penetration drills manufactured to customer's specification.

Micro-grain carbide tips, high speed steel shanks and drivers to suit customer's toolholder.

Four facet re-grindable point geometry.

Diameter range  $\phi 6.0$  to  $\phi 20.0$ . Hole depths up to 25:1.

## SOLID CARBIDE

Straight fluted, coolant fed drills manufactured from twin hole tungsten carbide rod.

Four facet re-grindable point geometry.

Manufactured to order, step drills available.

Diameter range  $\phi 6.0$  to  $\phi 20.0$ . Hole depths up to 10:1.

# SPEEDFEED DRILLS

The Speedfeed drill is a twin fluted, carbide tipped coolant fed drill.

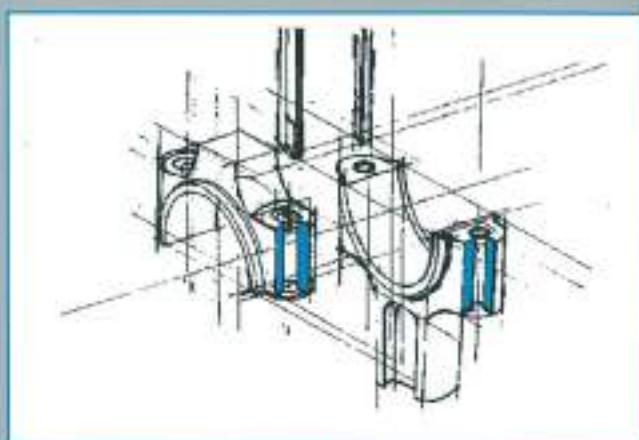

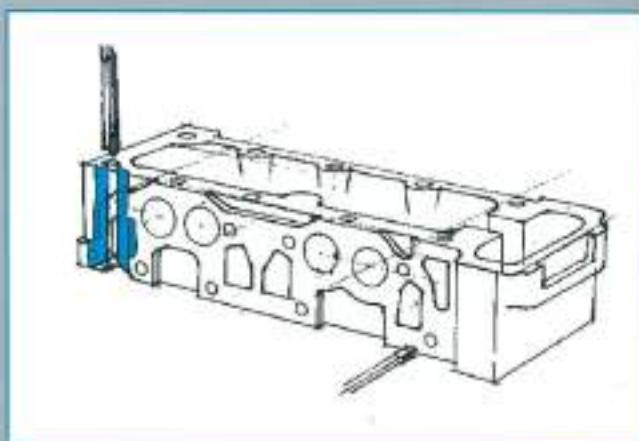

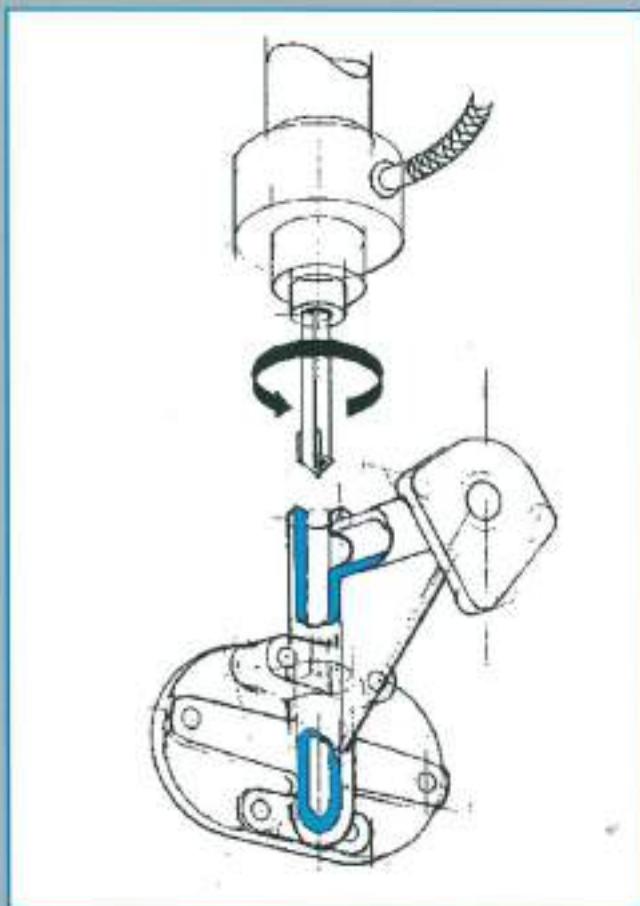

The micro grain solid carbide tip is multi regrindable.

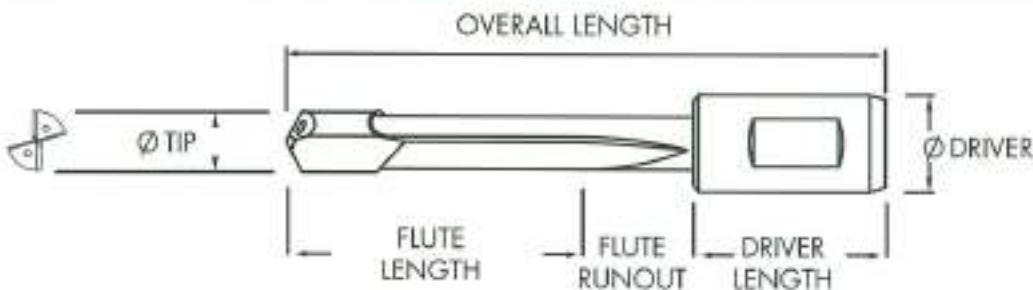

The tubular shank is formed and heat treated from high quality chrome molybdenum steel into an overlapping figure of eight cross section.

The maximum flute length is 500 mm subject to the application being suitable. (Please discuss new applications with Hammond & company's technical department).

Re-grinding with an SS-46 fixture assures continued performance and can be accomplished on a standard tool and cutter grinder. A re-grinding service is available at our Hemel Hempstead factory.

- Carbide tipped
- Multi-re-grindable
- ø5.0 to ø30.0
- Up to 25:1 length diameter
- High penetration rates
- Good size control and surface finish

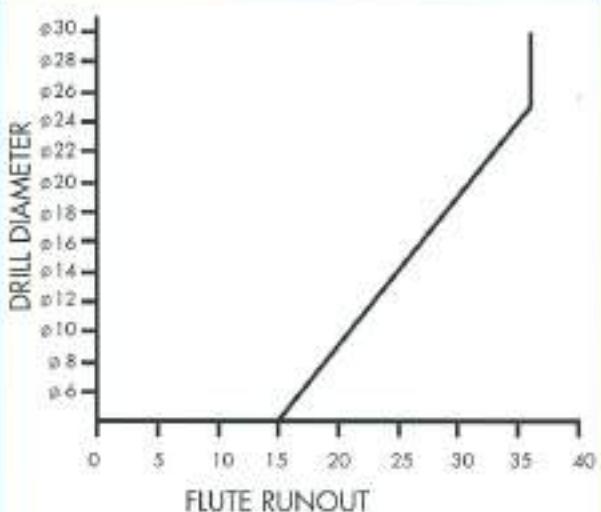

## ORDERING INFORMATION

**Please specify:** Drill diameter

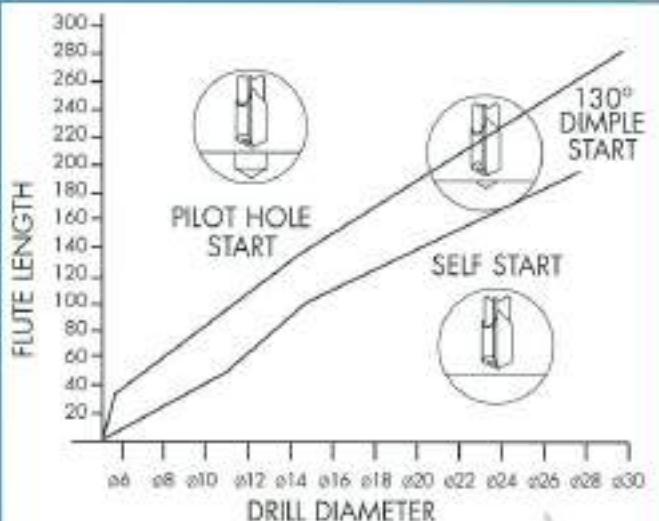

Flute length (depth of hole + 1.5 diameters)

Driver code (see below, if driver is not listed please give details).

10 - 20	0,6 - 0,8
20 - 30	0,8 - 1,2

The ideal method of re-grinding speedfeed drills is to use the Hammond re-grind fixture SS46; this ensures that both the tip diameter and the driver are concentric and on the same centre of rotation.

The cutting edges must be ground within 0,025 of each other and the centreline of the drill.

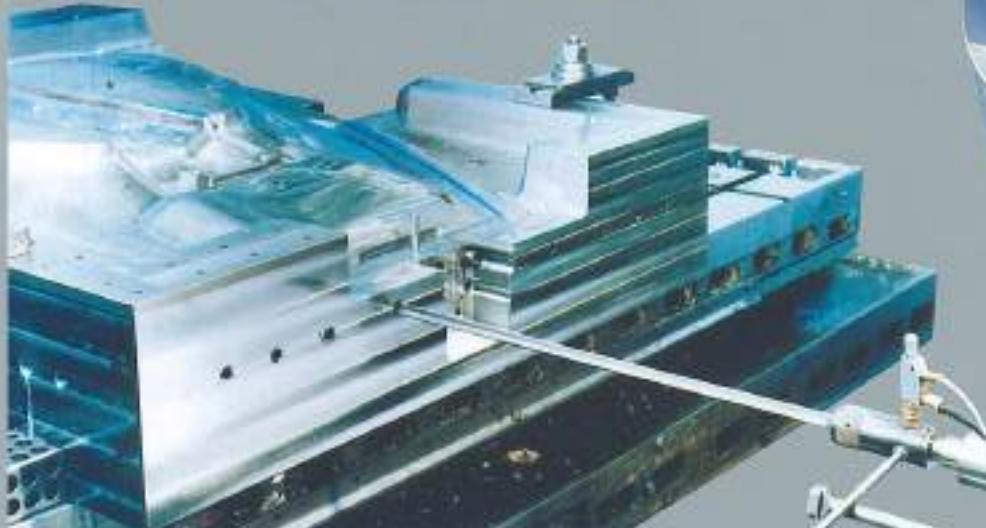

RE-GRIND FIXTURE

The problems of twist drilling deep holes are well known in the engineering industry. Drill wander, poor size control and surface finish, flank wear, binding and breakage are occupational hazards. The operation can be slow and inaccurate in the extreme.

An alternative is the use of Ventec drills which are designed to bring the benefits of gun drilling technology to conventional machine tools. Now for a relatively small outlay, it is possible to equip your machine shop with a system that provides a deep hole drilling capability, which in terms of speed and

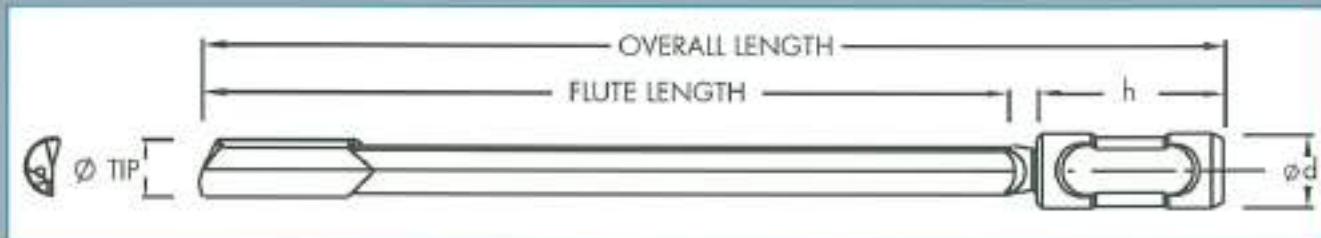

accuracy, equates favourably with gun drilling. In operation the tool must be supported in a short pilot hole before drilling commences. Thereafter, penetration is continuous and depth to diameter ratios of up to 70:1 are achievable. The cutting forces created by the offset tip geometry act upon the carbide bearing pods, burnishing the workpiece and achieving fine surface and size control. It is this accuracy of dimensional control which is responsible for the excellent concentricity achieved by a Ventec drill. It has literally nowhere to go but forward.

## MOULD TOOL DRILLING

K3000A SPRAYMIST See page 17

## VENTEC SPECIFICATION

## ORDERING INFORMATION

Please specify the drill diameter and flute length:

The flute length should equal the hole depth plus 2 x D. This allows for re-grinding.

If holes are deeper than 30 diameters they should be drilled in 30:1 stages.

The driver size will be fitted according to the chart below.

## DRIVERS

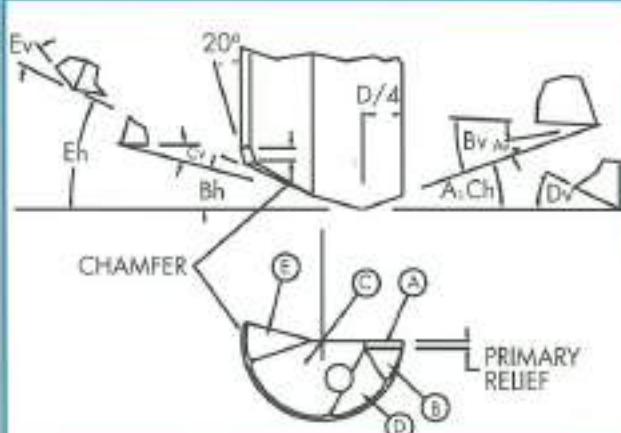

DRIVER STYLES	REF	TIP DIAMETER	Ød	h	OVERALL LENGTH

## DEEP DRILLING ON CNC MACHINES

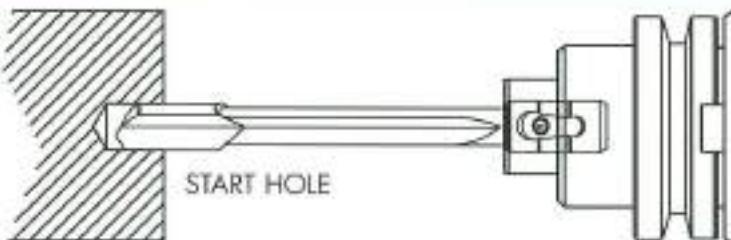

Modern CNC Machines are usually equipped with an adequate coolant supply enabling the deep drilling of holes up to 50 times diameter.

Hammond & company can also supply complete coolant delivery systems, tools and toolholding equipment to suit most CNC applications.

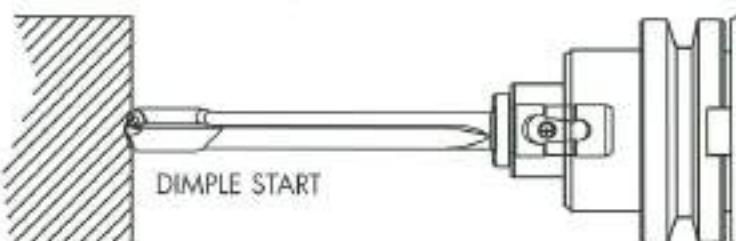

**GUNDRILL**  
 $\varnothing 3,0-32,0$

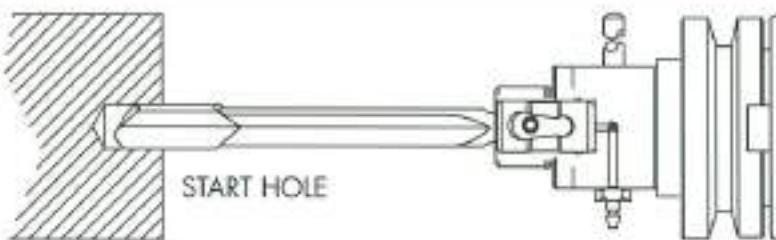

Gundrills are recommended where size control and concentricity are essential.

**SPEEDFEED  
DRILL**  
 $\varnothing 5,0-30,0$

Speedfeed drills are recommended for cast iron, aluminium and softer steels where fast penetration is essential.

**VENTEC  
DRILL**  
 $\varnothing 5,0-40,0$

Ventec drills using spraymist are recommended when the machine tool does not have a suitable coolant supply.

The hole produced will be of similar quality to a gun drilled hole.

## PUMPS

	<b>PART NO.</b>	
	K2000A	VENTEC SPRAYMIST UNIT 5 LITRES
	K3000A	VENTEC SPRAYMIST UNIT 15 LITRES
	K4000	HIGH PRESSURE COOLANT PUMP

**HIGH PRESSURE COOLANT**

The **K4000** Series High Pressure Pump can transform your machine to give a deep hole drilling capability equal to a purpose built Gun Drilling Machine.

Coolant is utilised from the machine's existing coolant tank. To control coolant temperature the machine tool should have a tank capacity of at least 300 litres.

**K4000** Pumps can cope with debris and swarf up to 500 microns. However, to prevent debris collecting or catching in the transfer pipes or drill coolant holes a magnetic strainer on the pump inlet is essential. For smaller drills and holes with fine surface finish requirements good quality filtration is a must. Suitably enclosed guarding is required to contain the high-pressure coolant.

For gun drilling operations, a soluble oil with high-pressure additives mixed to a 10%–15% solution or a good quality gun-drilling type mineral oil should be used.

The maximum output of the K4000 pump is 26 litres/min at 70bar (1000psi).

The output from the pump can be controlled by a solenoid valve which diverts the coolant to the drill or back to the tank. This can be activated by the machine's "M" codes.

If the machine does not have a suitable coolant capacity, we can supply the pump mounted vertically into a 300 litres Auxiliary Coolant Tank fitted with an integral float switch, sight glass, magnetic strainer and safety overflow. The float switch controls a free standing scavenge pump which in turn controls the fluid level in the auxiliary tank. The solenoid valve can also be mounted on this unit, giving the flexibility to being able to move the unit from machine to machine.

**SPRAYMIST**

The **K2000A** and **K3000A** spray mist units can be quickly fitted to most machine tools to give a deep hole drilling capability; they are portable and require only to be connected to the factory compressed air supply. The **Ventec drilling system** works in the following way. A 3:1 air driven pump situated inside the spraymist unit pressurises a 10% solution of a special emulsion oil; the oil is atomised by the compressed air at an adjustable sprayjet head and delivers the resulting mist mixture into the toolholder and through the **Ventec drill**. At the cutting face the mist mixture expands as it exits the hole in the carbide tip producing a refrigerating effect. The heat from the cutting process evaporates the water content of the mist leaving high lubricity oil to lubricate the burnishing pads of the cutting tip. The compressed air ejects the chips back along the drill flute and out of the hole.

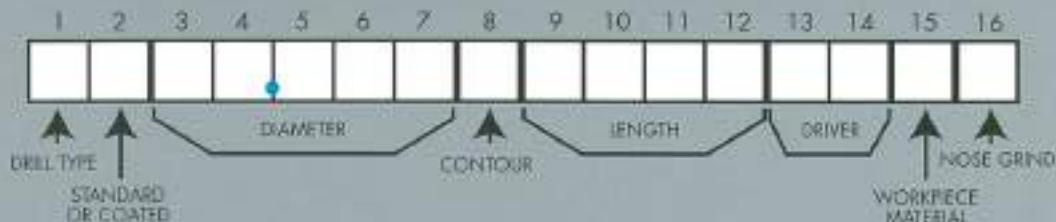

The incoming air pressure should be 5.5–8.5 Bar (80–125psi). The coolant pressure should be set 3.5 Bar (45–75psi) above this pressure. The mist flow should be adjusted until a light mist is visible at the commencement of drilling. During the drilling cycle a trickle of fluid should just be noticeable returning along the drill shank and slightly wetting the face of the workpiece. To achieve optimum results the Ventec cutting oil mixing instructions must be followed exactly.

We also offer a range of standard and custom built Coolant Fed Toolholders (see page 15) and a service to design and retrofit High Pressure coolant transfer systems to most CNC Lathes and Machining Centres.
